Smile: Atomic imaging finds root of tooth decay

The title

A collaboration between researchers from Cornell University, Northwestern University and University of Virginia combined complementary imaging techniques to explore the atomic structure of human enamel, exposing tiny chemical flaws in the fundamental building blocks of our teeth. The findings could help scientists prevent or possibly reverse tooth decay.

The team's paper, "Chemical Gradients in Human Enamel Crystallites," published July 1 in Nature. Cornell's contribution was led by Lena Kourkoutis, associate professor in applied and engineering physics. Derk Joester, professor of materials science and engineering at Northwestern, directed the research.

EXPERTS:

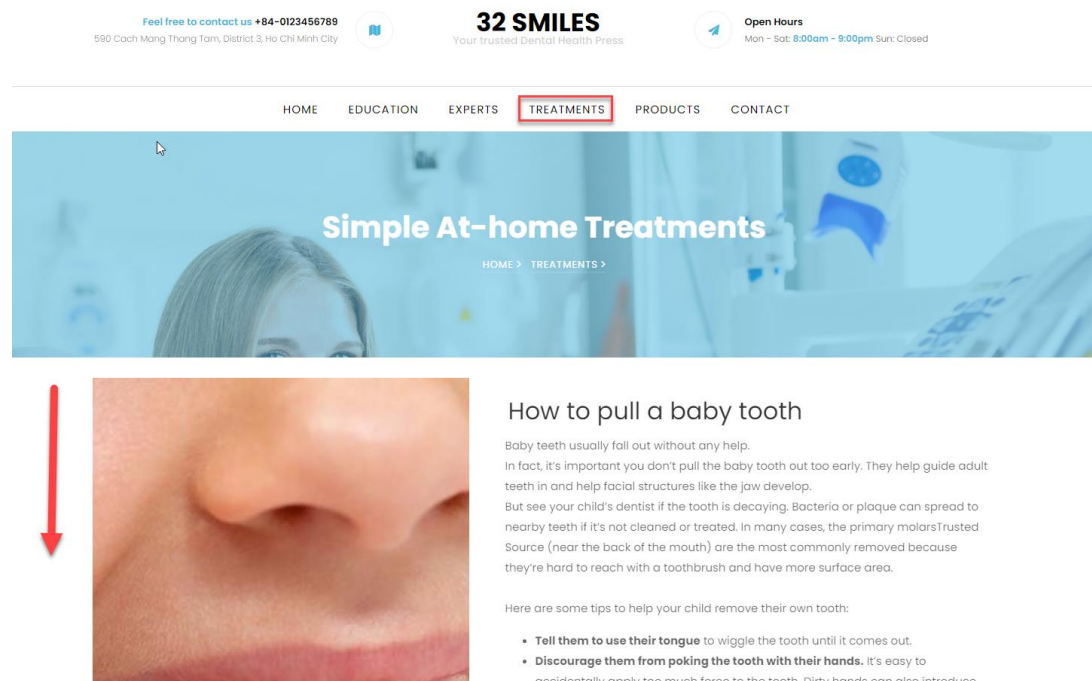

First, you need to click experts on the menu bar.

This page is about our experts, you can visit or send message through their social network like twitter, Facebook, google+ or Instagram by the way clicking on the button that is below their avatar.

TREATMENTS:

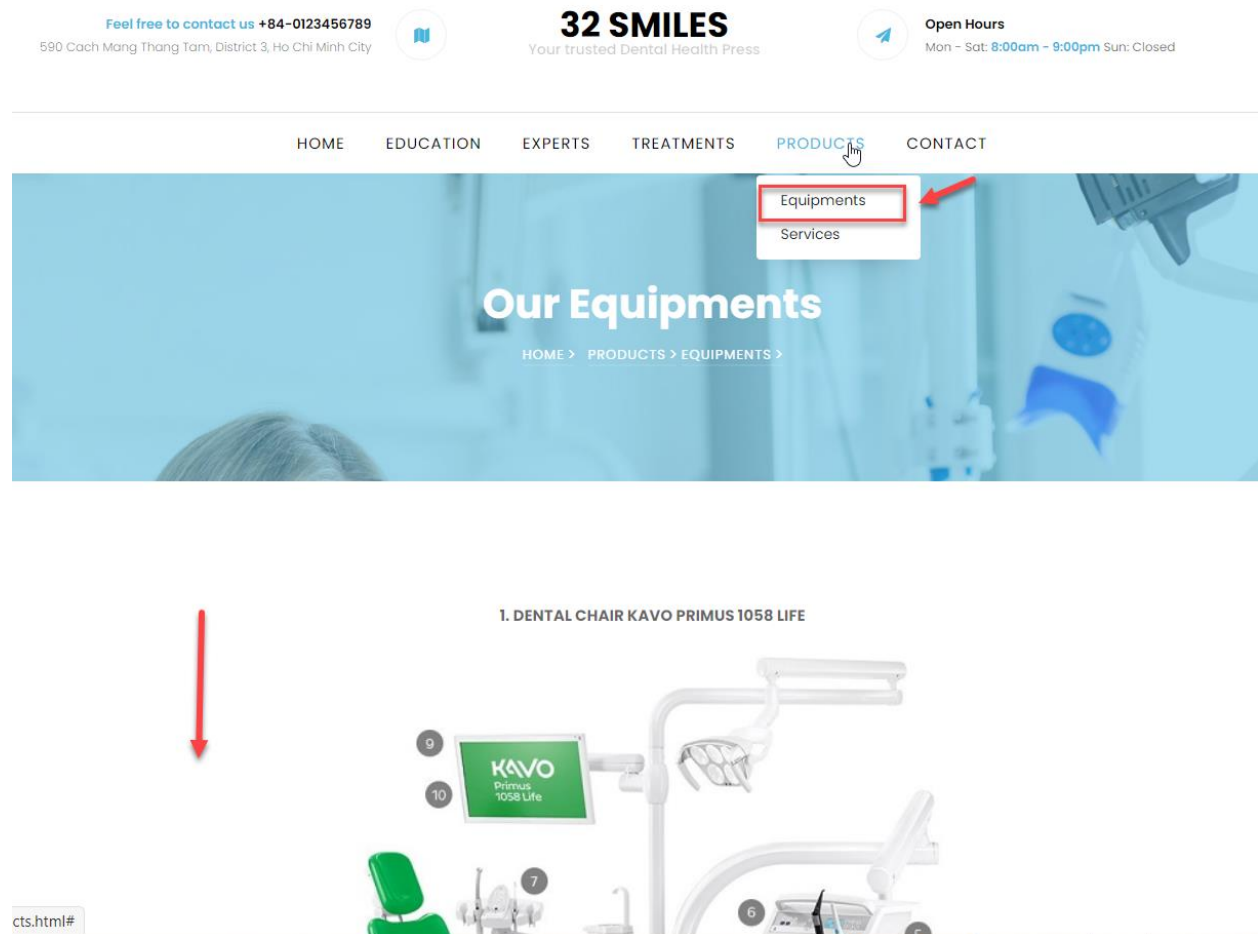

User presses treatments button, scroll vertically to see pieces of articles how to keep their teeth healthy. We provide some treatments that you can do at home easily.

PRODUCTS:

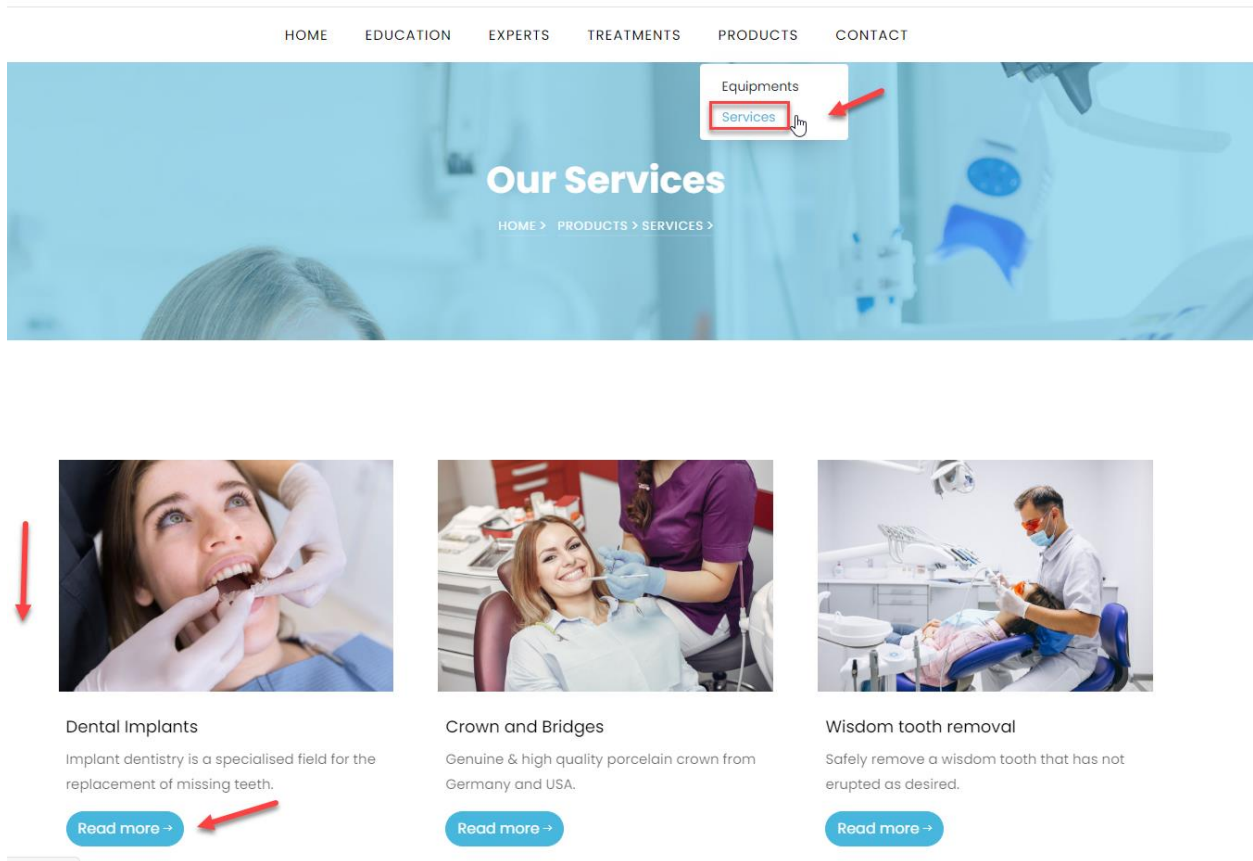

PRODUCTS – EQUIPMENTS:

User clicks on the product button, chooses equipment on the menu bar. Then scroll the screen to see the most common equipment that many clinics use. This page has the detail information of each equipment.

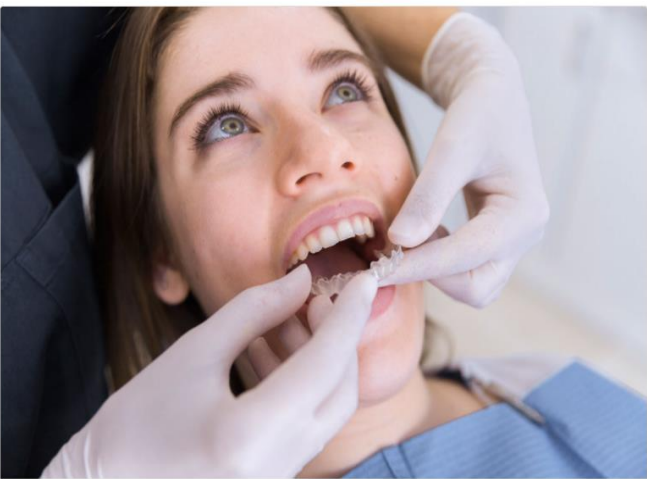

PRODUCTS – SERVICES:

Like equipment, user clicks products chooses services. You will see a list of services that our office offers. For more information, you click on read more button.

It provides essential information, you will know what to prepare. When you have done, press close button in the right corner.

DENTAL IMPLANTS

Implant dentistry is a specialised field for the replacement of missing teeth. This is done with titanium fixtures placed in the jawbone. These fixtures are used to support missing teeth. Dentists will place the titanium fixtures and some time is necessary for the bone to heal completely around these fixtures, after which crowns can be placed via intermediate abutments.

At 32 SMILES, computer-aided dental implant treatment is employed. The recent development of our digital workspace has fully integrated various technologies (that improve the predictability and safety of implant treatment) to provide a one-stop facility for performing Computer-Aided Implant Treatment.

Our specialists have collaborated with various institutions and private clinics to teach and further enhance the standards of predictability and safety of implant treatment. The use of specialised computer software and digital 3-dimensional x-ray facility has allowed our dentists to plan and perform implant surgeries in a virtual space. This serves to prepare our dentists during the performance of the actual surgery and hence improves the safety and predictability of implant treatment. Specialised laboratory equipment and trained technicians are available on-site to ensure a precise fit and the quality of your new teeth.

CROWN

CROWN are needed when the tooth is badly damaged either by trauma or decay. Also, in the instance of a Root Canal Treatment, a crown needs to be done to protect the tooth. Significantly stronger than normal fillings, inlays and Onlays, crowns protect teeth that otherwise may eventually break and become untreatable. Crowns cover the entire tooth surface and are made of Full Porcelain, Zirconia or Porcelain over Metal. With advances in materials and techniques, crowns can give you the strength, beauty and translucency of a natural tooth.

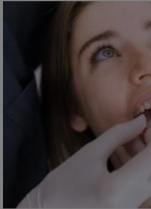

What crowns do for you

Protect teeth that is too badly broken down and may break easily. Protect teeth that are cracked (Cracked Tooth Syndrome) Made entirely of Zirconia, which is strong and durable. In some cases, they may be used in place of Full Metal Crowns. Can be used to support and replace extremely worn-out or broken-down dentition. Crowns together with Dental Veneers, can be used in combination in Smile Makeover situations. Your dentist will select the most suitable material for the Crown that suits your aesthetic and functional needs.

Treatment process

BRIDGES

If you have an unsightly space due to missing tooth (teeth), BRIDGES can help to restore your smile and dental function. It is not only naturally pleasing, it can be long-lasting too. Bridges
